// Simulation of the CGMY process with Levy measure trunc
    ated at level eps
// (jumps smaller than eps in absolute value are replaced
    with their mean)
// Uses the algorithm in Madan and Yor (), see also Poirot
    and Tankov (2006)
// The Levy measure of CGMY process is
// C exp(-M x) / x^{1+Y} 1_{x>0} + C exp(-G |x|) / |x|^{1+
    Y} 1_{x<0}
// the gamma parameter of the Levy triplet is chosen in su
    ch way that
// the mean of X_1 is equal to C gamma(1-Y) (M^{Y-1}-G^{Y-1
    })
// this is the natural 'zero drift' version of the process
// corresponding to using a subordinator without drift
