ap_fixedasian_thompsonup

Output parameters:

- Price
- Delta

Description: Fixed Asian options are priced with Thompson upper bound[1]. It is tighter than the upper bound given in Rogers-Shi[2].

/* Formula 4.4 of Thompson */

/* This is the integral of the formula 4.4 in Thompson */

/* Integrand for upper bound */

/*Increment for the Delta*/

/*Scaling of the parameters*/

/*Integrate, using the Laguerre quadrature, for obtaining the upper bound

*/

/* Call Price */

Taking the Call price formula from [1].

/* Put Price from Parity*/

Simple calculus give the call-put parity relationship

$$P_{T,t}(K) = C_{T,t}(K) + K * \exp(-r * (T - t)) - S(t) * \exp(-r * (T - t)) * (\exp(-(r - \text{divid}) * (T - t)) - 1) * \frac{1}{(T-t)*(r-\text{divid})}$$

/*Delta for call option*/

The delta is obtained with finite difference

/*Delta for put option*/

We use again the call-put parity relation

$$\Delta_P = \Delta_C - \exp(-r * (T - t)) * (\exp(-(r - \text{divid}) * (T - t)) - 1) * \frac{1}{(T - t) * (r - \text{divid})}$$

/*Price*/

/*Delta */
