cf_put

Let

- $T = \text{maturity date} \quad (T > t)$
- K = strike price
- x = spot price
- t = pricing date
- $\sigma = \text{volatility}$
- r = interest rate
- $\delta = \text{dividend yields}$
- $\bullet \quad \theta = T t$
- $b = r \delta$

Set:

$$d_1 = \frac{\log\left(\frac{x}{K}\right) + \left(b + \frac{\sigma^2}{2}\right)\theta}{\sigma\sqrt{\theta}} \qquad d_2 = d_1 - \sigma\sqrt{\theta}$$

and N as the cumulative normal distribution function:

$$N(d) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{d} e^{-x^2/2} dx.$$

Put Option

Payoff
$$P_T = (K - S_T)_+$$

Price $P(t, x; K) = Ke^{-r\theta}N(-d_2) - xe^{-\delta\theta}N(-d_1)$
Delta $\frac{\partial P(t, x)}{\partial x} = -e^{-\delta\theta}N(-d_1)$
