1   Description

We consider a two-factor stochastic volatility model (S_t, Y_t, Z_t), where S_t is the underlying price, and Y_t and Z_t are correlated diffusion processes. Under the risk-neutral probability measure, the model is described by the following equations:

$$
\begin{aligned}
dS_t &= rS_t dt + \sigma_t S_t dW_t^S, \\
\sigma_t &= f(Y_t, Z_t), \\
dY_t &= \left(\alpha(m_f - Y_t) - \nu_f \sqrt{2\alpha} \lambda_f(Y_t, Z_t) \right) dt \\
&\quad + \nu_f \sqrt{2\alpha} \left(\rho_1 dW_t^S + \sqrt{1 - \rho_1 2} dW_t^Y \right), \\
dZ_t &= \left(\delta(m_s - Z_t) - \nu_s \sqrt{2\delta} \lambda_s(Y_t, Z_t) \right) dt \\
&\quad + \nu_s \sqrt{2\delta} \left(\rho_2 dW_t^S + \rho_{12} dW_t^Y + \sqrt{1 - \rho_2 2 - \rho_{12} 2} dW_t^Z \right).
\end{aligned}
$$

Here (W_t^S, W_t^Y, W_t^Z) are independent standard Brownian motions, and the correlation coefficients ρ_1, ρ_2, and ρ_{12} satisfy $-1 < \rho_1 < 1$, $\rho_2 2 + \rho_{12} 2 < 1$ respectively.
