mc_longstaffschwartz

Input parameters:

- Number of iterations N

- Generator Type

- Increment inc

- Regressor Basis $basis$

- Dimension Approximation $dimapprox$

- Number of Exercise Date $exercise\ datenumber$

Output parameters:

- Price P

- Delta δ

Description:
Computation of Bermudian Option Price with the Longstaff-Schwartz algorithm that gives an estimation of an optimal stopping time using regression method. [1]. Longstaff-Schwartz Method
