Input parameters:

- SpaceStepNumber N

- TimeStepNumber M

Output parameters:

- Price

- Delta

there

/*Memory Allocation*/

/*Space localization/*
Define the integration domain $D = [x_{min}, x_{max}]$ using inequality there.

/*Space Step/*
Define the space step $h = \dfrac{x_{max} - x_{min}}{N}$.

/* Integration formula */

/*"Probabilities" associated to point/*
cf. there

/* FFT jump-density /*

/*Terminal Values/*
Put the value of the payoff saved in $Obst$ into a vector P which will be used to save the option value.

/*Finite difference Cycle/*

At any time step, described by the loop in the variable *TimeIndex*, we have to explicitly the equation

/*Price*/

/*Delta*/

/*Memory Deallocation*/
